

Stabilita programu:

- 1, Zistiť, kedy nastane najbližšie zrážka
- 2, Upraviť dĺžku kroku tak, aby zrážka nastala v celom kroku

a, Čas zrážky so stenou:

$$\frac{L_y - (y + r)}{v_y} = t_s$$

$$\frac{L_y - (y - r)}{v_y} = t_s$$

$$t_{zs} = \min\{t_{s1}, t_{s2}\}$$

$$t_{zs} = \min\{t_{s1}, t_{s2}\}$$

$$n = 1 + \text{int}\left(\frac{t_{zs}}{\Delta t_0}\right)$$

$$\Delta t_{\text{new}} = \frac{t_{zs}}{n}$$

Zrážka v reálnom
krokoch čase:

$$1, \vec{r}_n \cdot \vec{v}_n < 0$$

$$2, (\vec{r}_n \cdot \vec{v}_n)^2 - v_n^2 (r_n^2 - 4R^2) \geq 0$$

$$\vec{r}_1(t) = \vec{r}_1(0) + \vec{v}_1 t \quad |\vec{r}_2(t) - \vec{r}_1(t)| = 2R \quad (*)^2$$

$$\vec{r}_2(t) = \vec{r}_2(0) + \vec{v}_2 t \quad |\vec{r}_2(0) - \vec{r}_1(0) + (\vec{v}_2 - \vec{v}_1)t|^2 = 4R^2$$

$$\vec{r}_2(0) = \vec{r}_2$$

$$\vec{r}_1(0) = \vec{r}_1$$

$$v_{n2}^2 t^2 + 2\vec{r}_n \cdot \vec{v}_{n2} t + r_n^2 - 4R^2 = 0$$

$$t = \frac{-2\vec{r}_n \cdot \vec{v}_{n2} \pm \sqrt{4(\vec{r}_n \cdot \vec{v}_{n2})^2 - 4v_{n2}^2(r_n^2 - 4R^2)}}{2v_{n2}^2}$$
